**OPTIONS**

- F** *format*  
 Sets the format for the input swath data using **MBIO** integer format identifiers. This program uses the **MBIO** library and will read any swath format supported by **MBIO**. A list of the swath data formats currently supported by **MBIO** and their identifier values is given in the **MBIO** manual page. Default: *format* = 11.
- H** This "help" flag cause the program to print out a description of its operation and then exit immediately.
- I** *filename*  
 Sets the input filename. If *format* > 0 (set with the **-F** option) then the swath data contained in *infile* is read and processed. If *format* < 0, then *infile* is assumed to be an ascii file containing a list of the input swath data files to be processed and their formats. The program will read the data in each one of these files. In the *infile* file, each data file should be followed by a data format identifier, e.g.:  

```
datafile1 11
datafile2 24
```

 This program uses the **MBIO** library and will read any swath format supported by **MBIO**. A list of the swath data formats currently supported by **MBIO** and their identifier values is given in the **MBIO** manual page. Default: *infile* = "datalist.mb-1".
- V** The **-V** option causes **mbROUTETIME** to print out status messages.

**EXAMPLES**

Suppose you are going to run the MBARI Mapping AUV on the Coaxial Segment of the Juan de Fuca Ridge. You have created a route file called Coaxial2009\_1v3.rte using **mbGRDVIZ**. In order to create an MBARI AUV mission script for mission beginning with a spiral descent to an altitude of 50 m, followed by a survey run at a 75 m altitude, the following will suffice:

```
mbROUTETIME -I Coaxial2009_1v3.rte -A75/30/75 -B1 -G0 -MSL
-N50 -R220/83/0.3 -O Coaxial2009_1v3.cfg -S1.5 -L30 -W100 -V
```

The resulting mission script has the following header:

```
# This MBARI Mapping AUV mission file has been generated
# by the MB-System program mbROUTETIME run by
# user <caress> on cpu <shepard> at <Thu Jul 30 11:36:47 PDT 2009>
