NAME

mbkongsbergpreprocess − performs preprocessing of data from third generation Kongsberg multibeam sonars (e.g. EM122, EM302, EM710, EM2040, M3).

VERSION

Version 5.0

SYNOPSIS

mbkongsbergpreprocess [**−C** **−D***outputdirectory* **−E***offx/offy[/offdepth]* **−F***format* **−I***file* **−O***outfile* **−P***sonardepthfile* **−PF***filterlength/filterdepth* **−S***datatype/source* **−T***timelag* **−W** **−H** **−V**]

DESCRIPTION

mbkongsbergpreprocess reads data from a third generation Kongsberg multibeam sonar (e.g. EM122, EM302, EM710, EM2040, M3), interpolates the asynchronous navigation, heading, and attitude onto the multibeam data, and writes a new file with that information correctly embedded in the multibeam survey data. The input files may be in the vendor format MBF_EM710RAW (format id 58) or the **MB-System** extended format MBF_EM710MBA (format id 59); the output files will always be in the **MB-System** extended format MBF_EM710MBA (format id 59).

Like most modern swath survey data streams, Kongsberg multibeam data includes navigation, attitude, and heading data logged in separate data records as output by the respective sensors. Since each of these values is time stamped according to its origin rather than synced with multibeam pings, these values are asynchronous relative to the survey ping data. When multiple sources of navigation, heading, and/or attitude have been recorded in a data stream, **mbkongsbergpreprocess** allows the user to specify which asynchronous data are extracted and interpolated onto the survey data using the **−S** option.

This program allows the correction of a time latency (or time lag) error between the sonar data and the attitude and navigation data using the **−T** option.

The format 58 files This program also creates four ancillary files containing the full asynchronous attitude, sonar depth, and heading data and the synchronous attitude data in parallel with each output format 59 file. These files are used, when present, by **mbeditviz** to facilitate interactive analysis of time lag issues. Each of these are text files with white-space delimited columns; the first column is always time in decimal unix seconds. These have the following suffixes:

asynchronous attitude (roll and pitch):	*.ata
asynchronous heading:	*.ath
asynchronous sonar depth:	*.ats
synchronous attitude (roll and pitch):	*.sta

By default, **mbkongsbergpreprocess** ignores water column records and does not pass these large records into the output format 59 files. The **-W***1* option causes the water column records to be written in the output files.

OPTIONS
   −C
            This option causes **mbkongsbergpreprocess** to print counts of the many different data record
            types compising a Kongsberg data stream. The data record counts are output for each file and as
            totals from all files processed.

   −D   *outputdirectory*
            This option causes all format 59 output files to be placed in the specified directory *outputdirectory*
            rather than parallel to the original "raw" files.

   −E   *offx/offz[/offdepth]*
            This option is for data from submerged platforms such as ROVs or AUVs. This sets horizontal
            and vertical.distance offsets between the vehicle's depth sensor and the multibeam receive head. If
            specified, these values are used in a lever-arm calculation to determine the sonar depth change as-
            sociated with vehicle pitch. The *offdepth* value, if specified, is a static depth offset to be applied to
            the vehicle depth data.

   −F   *format*
            Sets the data format used if the input is read from stdin or from a file. If *format* < 0, then the input
            file specified with the **−I** option will actually contain a list of input swath sonar data files. This pro-
            gram only reads third generation Kongsberg multibeam format data files (**MBIO** formats 58 and
            59).

   −H   This "help" flag cause the program to print out a description of its operation and then exit immedi-
            ately.

   −I   *infile*
            Sets the input file path. If *format* > 0 (set with the **−f** option or **mbdefaults**) then the swath sonar
            data contained in *infile* is read and processed. If *format* < 0, then *infile* is assumed to be an ascii
            file containing a list of the input swath sonar data files to be processed and their formats. The pro-
            gram will read the data in each one of these files. In the *infile* file, each data file should be fol-
            lowed by a data format identifier, e.g.:
                    datafile.all 58
                    datafile.all 58
            This program only reads third generation Kongsberg multibeam format data files (**MBIO** formats
            58 and 59).

   −O   *outfile*
            This option causes **mbkongsbergpreprocess** to output all data to a single file specified as *outfile*.
            By default, the program creates output files for each input file. If the **−D***outputdirectory* option is
            also used, then the output file *outfile* will be in *outputdirectory*.

   −P   *sonardepthfile*
            The program will read sonar depth data from *sonardepthfile* and merge those data with the multi-
            beam, sidescan, and subbtottom data in the 7k file. The *sonardepthfile* is a text data file containing
            two space delimited columns:
                    time_d sonardepth
            where:
                    time_d – decimal epoch seconds (since start of 1970)
                    sonardepth – sonar depth in meters, positive down

   −PF   *filterlength/filterdepth* This option specifies Gaussian tapered time domain filtering of the sonar
            depth data to be merged with the survey data, regardless of source. The *filterlength* value specifies
            the filter window length in seconds, and the *filterdepth* value controls the depths to which filtering
            is applied. The filtered sonar depth is used to depths up to twice the *filterdepth* value. Below that
            threshold, the value used transitions to unfiltered with an exponential taper. This filtering is used in
            two ways. First, one can apply short period smoothing of noisy sonar depth at all by specifying a
            small *filterlength* (e.g. 2 seconds) and a *filterdepth* value deeper than the vehicle's track. Second,
            when an AUV or ROV is operated at shallow depths, the pressure values used to determine depth

are affected by waves at the sea surface. In this case, a longer period *filterlength* (e.g. 10 seconds) and a shallower *filterdepth* (e.g. 50 meters) may be used to lessen the artifacts due to surface swell.

–S *datatype/source*
This option specifies which data records should be the source of the navigation (*datatype* = 1), heading (*datatype* = 2), attitude (*datatype* = 3), and sonar depth (*datatype* = 4) data that are interpolated onto the survey ping times. In each case the *source* value specifies a data record type. The possibilities for Kongsberg data include:

MB_DATA_DATA	1	
MB_DATA_NAV	12	
MB_DATA_HEIGHT		16
MB_DATA_HEADING		17
MB_DATA_ATTITUDE		18
MB_DATA_NAV1		28
MB_DATA_NAV2		29
MB_DATA_NAV3		30
MB_DATA_ATTITUDE1		55
MB_DATA_ATTITUDE2		56
MB_DATA_ATTITUDE3		57

The default sources for position, heading and sensor depth are:
nav_source = MB_DATA_NAV
heading_source = MB_DATA_NAV
sonardepth_source = MB_DATA_DATA
The default source for attitude is set according to the sensor that was active during data collection, most often:
attitude_source = MB_DATA_ATTITUDE

–T *timelag*
This option specifies a *timelag* value in seconds to be applied to the navigation and attitude data prior to it being merged with the bathymetry. If *timelag* is a valid path to a file containing time stamp and time lag pairs, then these data will be read and the time lag applied to particular records will be interpolated by time.

–W *mode*
By default, **mbkongsbergpreprocess** ignores water column records and does not pass these large records into the output format 59 files. If **-W***1* is specified, then the water column records will be written to the output files.

EXAMPLES
Suppose that one has collected a set of three Kongsberg EM122 data files named:
0000_20111219_154640_METEOR_EM122.all
0001_20111219_163703_METEOR_EM122.all
0002_20111219_175708_METEOR_EM122.all
First, we want to generate a "datalist" file referencing the raw survey files. The following will suffice:
/bin/ls −1 *all | awk '{print $1" 58"}' > datalist_raw.mb-1
We want to use **mbkongsbergpreprocess** to gracefully interpolate the asynchronous navigation, heading and attitude data onto the survey data and to generate data files in the extended format (MBF_EM710MBA = 59). To learn which potential sources of navigation, heading and attitude are available, use **mbinfo** with the **–N** option:
$ mbinfo −I 0000_20111219_154640_METEOR_EM122.all −N

The **–N** option causes **mbinfo** to generate a list of the data record types read in the file at the end of the file statistics:
Swath Data File: 0000_20111219_154640_METEOR_EM122.all
MBIO Data Format ID: 58
Format name: MBF_EM710RAW

Informal Description: Kongsberg current multibeam vendor format
Attributes: Kongsberg EM122, EM302, EM710,
                            bathymetry, amplitude, and sidescan,
                            up to 400 beams, variable pixels, binary, Kongsberg.

Data Totals:
Number of Records: 334
Bathymetry Data (432 beams):
  Number of Beams: 144288
  Number of Good Beams: 129951   90.06%
  Number of Zero Beams: 0   0.00%
  Number of Flagged Beams: 14337   9.94%
Amplitude Data (432 beams):
  Number of Beams: 144288
  Number of Good Beams: 129951   90.06%
  Number of Zero Beams: 0   0.00%
  Number of Flagged Beams: 14337   9.94%
Sidescan Data (1024 pixels):
  Number of Pixels: 342016
  Number of Good Pixels: 289910   84.77%
  Number of Zero Pixels: 0   0.00%
  Number of Flagged Pixels: 52106   15.23%

Navigation Totals:
Total Time: 0.8327 hours
Total Track Length: 13.6418 km
Average Speed: 16.3823 km/hr (8.8553 knots)

Start of Data:
Time: 12 19 2011 15:46:27.537000 JD353 (2011-12-19T15:46:27.537000)
Lon: −11.562232000   Lat: 36.848179850   Depth: 4931.4829 meters

Nonfatal Error Notices:
EN: 20551 MB_ERROR_NO_DATA_REQUESTED (ID=−11): No data requested for buffer load

Problem Notices:

This listing shows that the format 58 file includes MB_DATA_NAV (*source* = 12) and MB_DATA_NAV3 (*source* = 30) records, both of which include both position and heading data. Also included are three sources of attitude data: MB_DATA_ATTITUDE (*source* = 18), MB_DATA_ATTITUDE1 (*source* = 55), and MB_DATA_ATTITUDE2 (*source* = 56).

To extract and use the default navigation, heading, and attitude data, the following will suffice:
mbkongsbergpreprocess −I datalist_raw.mb-1 −V

An equivalent command that explicitly specifies the default asynchronous data sources using **−S***1/source* for navigation, **−S***2/source* for heading, and **−S***3/source* for attitude is:
mbkongsbergpreprocess −I datalist_raw.mb-1 −V **−S***1/12* **−S***2/12* **−S***3/18*

To interpolate navigation and heading from the secondary navigation source, use
−S*1/30* **−S***2/30*

To interpolate attitude from ancillary attitude system 2, use:
−S*3/56*
